## **DETAILED ACTION**

### ***Claim Objections***

1. Claims 5-10 and 15-21 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend on another multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims 5-10 and 15-21 are not further treated on the merits.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-4 and 11-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Andersson et al ( WO 01/81031) or Deckard (US 4,863,538) in view of Deckard et al (US 5,155,324) or Beaman et al (US 5,352,405).

Andersson or Deckard '538 shows the method and the arrangement claimed including a work table on which a three-dimensional product is to be built on a selected area, a power dispenser to provide successive thin layer of powder to be fused by a radiation gun, and a computer to control the radiation gun according to a programmed scheme or steps. But, Andersson and Deckard '538 do not explicitly show the selected area is divided into a plurality of small parts which of each including an inner area and an edge.

Deckard '324 shows that it is known to provide a selected area with a plurality of small inner areas with an edge that are scanned and fused by a radiation gun such as a laser (Fig 3a and 3b). Deckard '324 further shows that it is known to scan an edge of a selected area with its inner areas being scanned there after (Fig 4a and 4b). Beaman also shows that it is known in the art to provide a selected with a plurality of small inner areas with an edge wherein the inner areas that are further selected by the computer.

In view of Deckard '324 or Beaman, it would have been obvious to one of ordinary skill in the art to adapt Andersson or Deckard '538 with the selected area being divided into plurality of inner areas with an edge that defines the selected area and to fuse or scan the inner areas so that inner area with its edges being fused together and further defining the selected area with the computer controller setting and prioritizing the treatment of the selected area.
